## 1. Unique Features

- 1) 16 Channels
- 2) Supply Voltage ( $V_{DD}$ ) ..... 12V~33V
- 3) Higher than 200mA driver ability for each channel
- 4) Dual enable control signal
- 5)  $T_A$ .....-55°C~125°C
- 6) Package.....CQFP64
- 7) Total Ionizing Dose  $\geq$  100 krad (Si)
- 8) The Single Event Latch-up Immunity

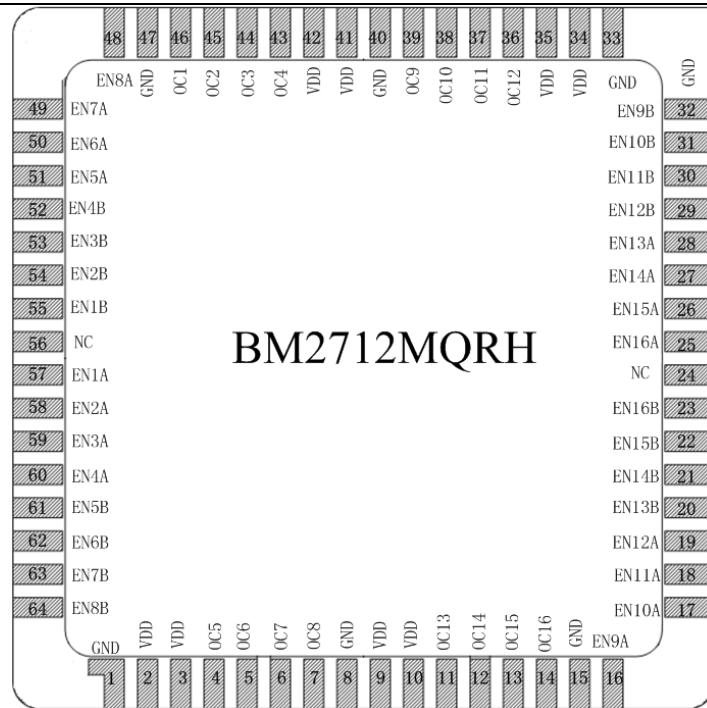

## 2. General Description

The device implements 16-channel switch instruction driver. Each channel can be controlled by two independent signals. When these two signals are simultaneously active (high level), the instruction signal will be presented at the output. The power loop can be switched on or off by the instruction signal. Each channel's pre-driver and post-switch circuits are designed by redundant structure that can improve circuit's reliability and robustness. There is an excellent isolation between each channel. If one channel is abnormal, the other channels won't be affected and can output exactly.

## 3. Pin Description

## 5.4 ESD Caution

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 2000 V readily accumulated on the human body fits the 2nd Level of 3015 in GJB548B-2005.

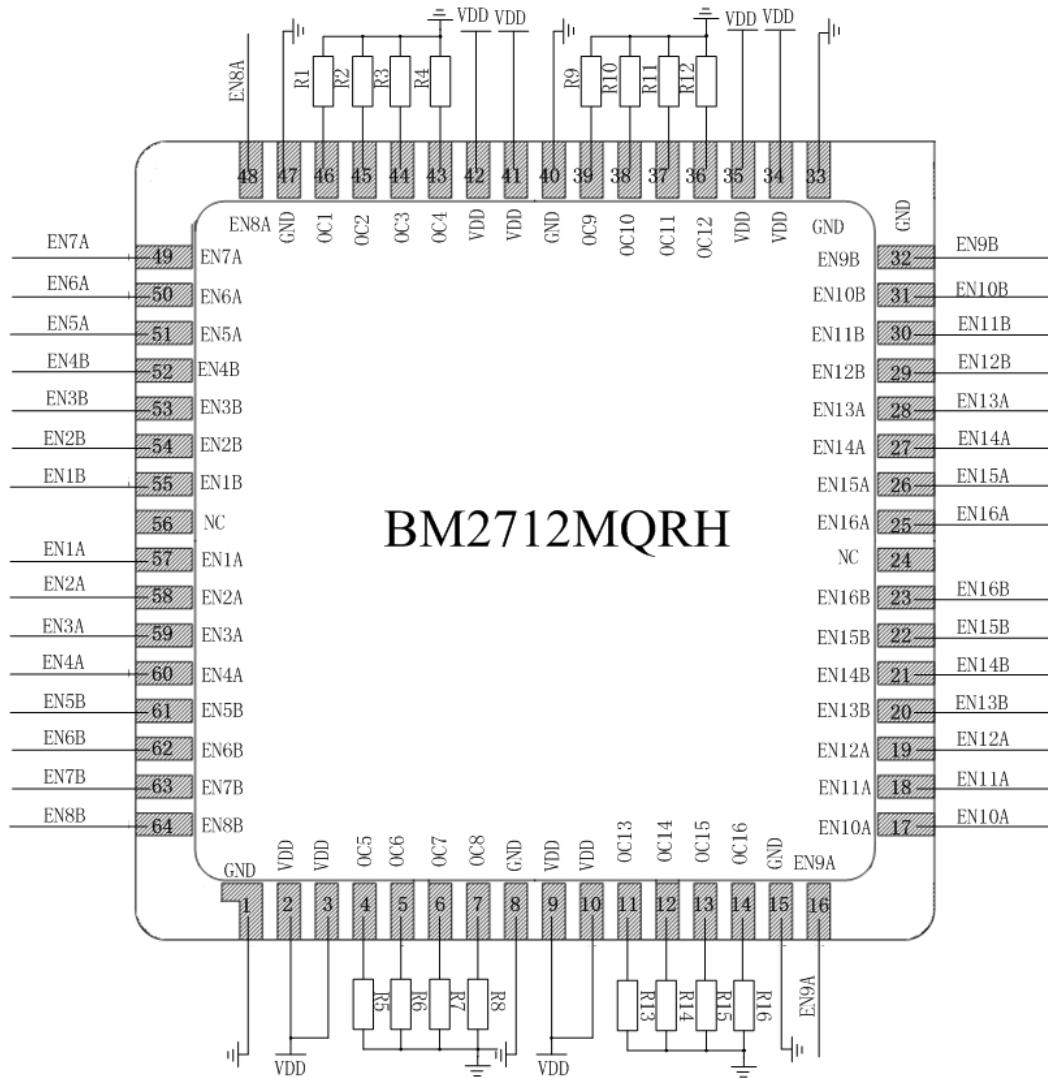

## 6. Typical Application

### 6.1 Typical Application Circuit

The GND pin should be connected to the reference ground of control signal, or the common ground of control signal ground and instruction signal ground. It can be

selected by customer.

The figure 5 shows that the GND pin is individually connected to the reference ground of control signal, and the ground of instruction signal. V<sub>DD</sub> is the power of instruct signal. GND is the reference ground of control signal. R<sub>i</sub> is the load of instruct signal which is connected to OC<sub>i</sub> and the ground.

**Figure 5. BM2712MQRH Typical Application Circuit**

## 6.2 Power Dissipation Expression

The number of active channels is limited by the device's maximum power consumption.

The device's power consumption is composed by three parts: the power consumption of input drives, power supplies and output drives. And the device's power consumption expression can be written as below:

$$P = I_{EN} \times V_{EN} + I_{VDD} \times V_{DD} + I_O \times V_{CESAT}$$

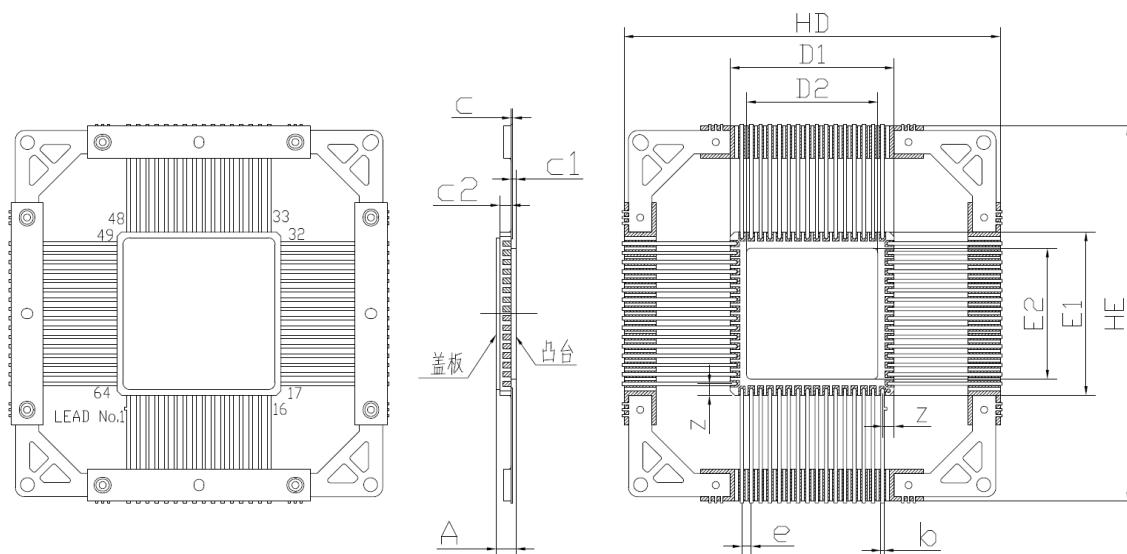

The maximum power consumption of the device is 2.5W, and each channel's power consumption could be derived by the parameters of the electrical characteristics table as following:

$$P_1=0.0008 \times 5.5 \times 2 + 0.05 \times 33 + 0.2 \times 3 = 2.2588\text{W}$$

So the number of active channels is only one because the whole power consumption of the device is all channels' power summation.
